# 1 Analysis

# 1.1 Problem Identification

# 1.1.1 Problem Description

Popular inventory management solutions are relatively expensive, and may be out of reach for individuals or small schools. Inventory systems have numerous benefits for businesses and individuals alike; a business may choose to track their supply levels where an individual may wish to catalogue their DVD collection.

My goal is to create a web-based application aimed at both businesses and individuals to manage inventory, with additional modern features such as automatic item re-ordering when stocks are running low.

Traditional inventory management solutions are typically single-user at best, whereas I intend to create a multi-user, collaborative environment.

In my view, an inventory system should be:

- Easy for end users to use.
- Cross platform
- Performant interface
- Efficient in terms of adding data
- Allow for easy cataloguing of inventory
- Allow for item scanning using QR codes / barcodes
- Be able to source data from external sources
- Support both consumable and non-consumable goods.

#### 1.1.2 Interview

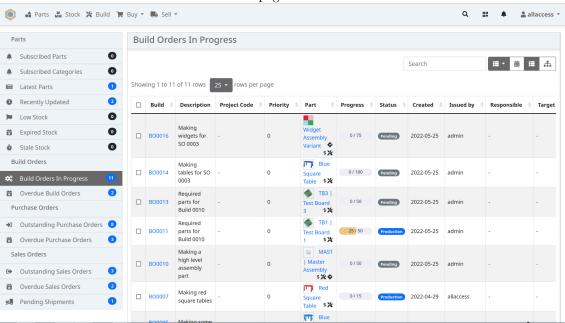

# 1.1.3 Existing similar solutions

InvenTree https://inventree.org/

# Overview

InvenTree is an **open-source** inventory management system, providing *low level stock control and part tracking*. It uses a Python/Django database backend and provides both a **web-based interface** as well as a REST API for interacting with other services. InvenTree also has a powerful plugin system for custom applications and other extensions.

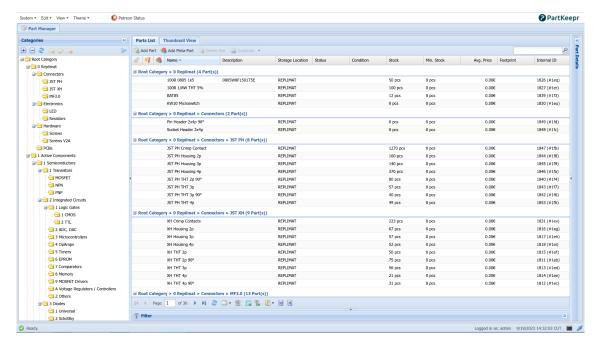

Below is a screenshot of the InvenTree homepage.

#### Parts applicable to my solution

- concept is similar (web-based), but I'm doing a different approach.
- not indented for stock control

# PartKeepr https://partkeepr.org/

#### Overview

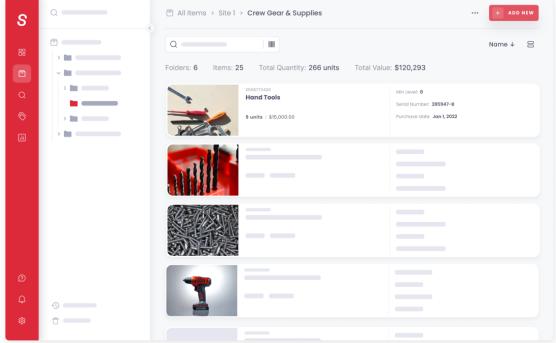

PartKeepr is an open-source inventory management system with a focus on electronic components. It is designed around four main principles:

- Fast Part Searching
- Ability to add complete part database
- Keeping track of stock
- Ease of use

# Parts applicable to my solution

Like PartKeepr, I hope to implement a web-based interface. However, I am using a different approach as my solution will not be tailored specifically to electronic components.

# Sortly https://www.sortly.com/solutions/inventory-management-software/

#### Overview

Sortly is a proprietary cloud-based inventory management system with a focus on small businesses and inviduals.

It has two plans available, an always free plan with limited functionality and a paid plan will a more complete feature-set.

# Parts applicable to my solution

I hope to implement the following features from Sortly:

- Web based interface
  - Allows for easy access.
- Barcode support
  - Allows end users to print off QR codes to stick to items
  - Which can be scanned in-app to easily perform actions on the item.
- Real-time reporting insights
  - Allows for added insight into usage patterns for particular units.

- 1.1.4 Features to be incorporated into solution
- 1.1.5 Feedback from stakeholders
- 1.2 Requirements
- 1.2.1 Stakeholder requirements
- 1.2.2 Software and hardware requirements
- 1.2.3 Success requirements

# 2 Design

- 2.1 User Interface Design
- 2.1.1 Usability Features
- 2.1.2 Feedback from stakeholder
- 2.2 Modular breakdown
- 2.3 Algorithms
- 2.4 Data Dictionary
- 2.5 Inputs and outputs
- 2.6 Validation
- 2.7 Testing
- 2.7.1 Methods
- 2.7.2 Test Plan
- 3 Implementation
- 3.1 First Iteration
- 4 Testing
- 5 Evaluation
